

## 4.1.2 Attribute Data Accuracy

Attribute data for each feature shall be correct, for both required attribute values, blank attribute values, and the correct attribute assignment applicable to the feature.

This requirement will typically be evaluated by programmatic checks and/or spot checks versus original source documents for the type of feature being checked. Prior to delivery to SFO, the Data Provider shall perform a spot check using a statistically significant sample size based on the approved random selection methodology. This test should document the procedures undertaken and that the actual results obtained were within the standard for attribute accuracy.
