

1.4 References to Parties

The San Francisco International Airport's Infrastructure Information Management Department is responsible for collecting and receiving all GIS related spatial and attribute information and content in accordance with the SFO GIS Standards.

The third party responsible for developing spatial data is referred to as the "Data Provider". The Data Provider may be internal or external to SFO. If external, then the submittal is usually controlled by contract, and submitted through the Project Manager for the Airport. Other construction or survey design and as-built data submitted to SFO GIS may have originated from other Airport departments, city stakeholders, surveyors, planners, surrounding cities, counties, and municipalities.

The SFO employee who is responsible for updating and maintaining a certain feature class of geospatial and attribute data such as buildings, marking lines, or utilities is referred to as the "Data Owner". Data Owners shall coordinate with the GIS Coordinator to ensure that all infrastructure changes in the field (both airside and landside) are properly updated and reflected within the central GIS Enterprise database in a timely fashion based upon proper data accuracy requirements.
